## PYRIMIDINE DERIVATIVES AS RHO-KINASE INHIBITORS

**Field of the Invention**

The present invention relates to compounds and derivatives thereof, their synthesis, and their use as Rho-kinase inhibitors. These compounds of the present invention are useful for inhibiting tumor growth, treating erectile dysfunction, and treating other indications mediated by Rho-kinase, e.g., coronary heart disease.

**Background**

The pathology of a number of human and animal diseases including hypertension, erectile dysfunction, coronary cerebral circulatory impairments, neurodegenerative disorders and cancer can be linked directly to changes in the actin cytoskeleton. These diseases pose a serious unmet medical need. The actin cytoskeleton is composed of a meshwork of actin filaments and actin-binding proteins found in all eukaryotic cells. In smooth muscle cells the assembly and disassembly of the actin cytoskeleton is the primary motor force responsible for smooth muscle contraction and relaxation. In non-muscle cells, dynamic rearrangements of the actin cytoskeleton are responsible for regulating cell morphology, cell motility, actin stress fiber formation, cell adhesion and specialized cellular functions such as neurite retraction, phagocytosis or cytokinesis (Van Aelst, et al. *Genes Dev* 1997, 11, 2295).

The actin cytoskeleton is controlled by a family of proteins that are a subset of the Ras superfamily of GTPases. This subset currently consists of RhoA through E and RhoG (referred to collectively as Rho), Rac 1 and 2, Cdc42Hs and G25K and TC10 isoforms (Mackay, et al. *J Biol Chem* 1998, 273, 20685). These proteins are GTP (guanine nucleotide triphosphate) binding proteins with intrinsic GTPase activity. They act as molecular switches and cycles between inactive GDP (guanine nucleotide diphosphate) bound and active GTP bound states. Using biochemical and genetic manipulations, it has been possible to assign functions to each family member. Upon activation the Rho proteins controls the formation of actin stress fibers, thick bundles of actin filaments, and the clustering of integrins at focal adhesion complexes. When activated the Rac proteins control the formation of lamellopodia or membrane ruffles on the cell surface and Cdc42 controls filopodia formation. Together this family of proteins plays a critical part in the

control of key cellular functions including cell movement, axonal guidance, cytokinesis, and changes in cell morphology, shape and polarity.

Depending on the cell type and the activating receptor, the Rho proteins can control different biological responses. In smooth muscle cells, Rho proteins are responsible for the calcium sensitization during smooth muscle contraction. In non-smooth muscle cells the Rho GTPases are responsible for the cellular responses to agonist such as lysophosphatidic acid (LPA), thrombin and thromboxane A<sub>2</sub> (Fukata, et al. *Trends Pharmacol Sci* 2001, 22, 32). Agonist response is coupled through heterotrimeric G proteins G<sub>α12</sub> or G<sub>α13</sub> (Goetzl, et al. *Cancer Res* 1999, 59, 4732; Buhl, et al. *J Biol Chem* 1995, 270, 24631) though other receptors may be involved. Upon activation Rho GTPases activate a number of downstream effectors including PIP5-kinase, Rhothekin, Rhophilin, PKN and Rho kinase isoforms ROCK-1/ROKβ and ROCK-1/ROKα (Mackay and Hall *J Biol Chem* 1998, 273, 20685; Aspenstrom *Curr Opin Cell Biol* 1999, 11, 95; Amano, et al. *Exp Cell Res* 2000, 261, 44).

Rho kinase was identified as a RhoA interacting protein isolated from bovine brain (Matsui, et al. *Embo J* 1996, 15, 2208). It is a member of the myotonic dystrophy family of protein kinase and contains a serine/threonine kinase domain at the amino terminus, a coiled-coil domain in the central region and a Rho interaction domain at the carboxy terminus (Amano, et al. *Exp Cell Res* 2000, 261, 44). Its kinase activity is enhanced upon binding to GTP-bound RhoA and when introduced into cells, it can reproduce many of the activities of activated RhoA. In smooth muscle cells Rho kinase mediates calcium sensitization and smooth muscle contraction and inhibition of Rho kinase blocks 5-HT and phenylephrine agonist induced muscle contraction. When introduced into non-smooth muscle cells, Rho kinase induces stress fiber formation and is required for the cellular transformation mediated by RhoA (Sahai, et al. *Curr Biol* 1999, 9, 136). Rho kinase regulates a number of downstream proteins through phosphorylation, including myosin light chain (Somlyo, et al. *J Physiol (Lond)* 2000, 522 Pt 2, 177), the myosin light chain phosphatase binding subunit (Fukata, et al. *J Cell Biol* 1998, 141, 409) and LIM-kinase 2 (Sumi, et al. *J Bio Chem* 2001, 276, 670).

Inhibition of Rho kinase activity in animal models has demonstrated a number of benefits of Rho kinase inhibitors for the treatment of human diseases. Several patents

have appeared claiming (+)-trans-4-(1-aminoethyl)-1-(pyridin-4-ylaminocarbonyl)cyclohexane dihydrochloride monohydrate (WO-00078351, WO-00057913) and substituted isoquinolinesulfonyl (EP-00187371) compounds as Rho kinase inhibitors with activity in animal models. These include models of cardiovascular diseases such as hypertension (Uehata, et al. *Nature* 1997, 389, 990), atherosclerosis (Retzer, et al. *FEBS Lett* 2000, 466, 70), restenosis (Eto, et al. *Am J Physiol Heart Circ Physiol* 2000, 278, H1744; Negoro, et al. *Biochem Biophys Res Commun* 1999, 262, 211), cerebral ischemia (Uehata, et al. *Nature* 1997, 389, 990; Seasholtz, et al. *Circ Res* 1999, 84, 1186; Hitomi, et al. *Life Sci* 2000, 67, 1929; Yamamoto, et al. *J Cardiovasc Pharmacol* 2000, 35, 203), cerebral vasospasm (Sato, et al. *Circ Res* 2000, 87, 195; Kim, et al. *Neurosurgery* 2000, 46, 440), penile erectile dysfunction (Chitaley, et al. *Nat Med* 2001, 7, 119), central nervous system disorders such as neuronal degeneration and spinal cord injury (Hara, et al. *J Neurosurg* 2000, 93, 94; Toshima, et al. *Stroke* 2000, 31, 2245) and in neoplasias where inhibition of Rho kinase has been shown to inhibit tumor cell growth and metastasis (Itoh, et al. *Nat Med* 1999, 5, 221; Somlyo, et al. *Biochem Biophys Res Commun* 2000, 269, 652), angiogenesis (Uchida, et al. *Biochem Biophys Res Commun* 2000, 269, 633; Gingras, et al. *Biochem J* 2000, 348 Pt 2, 273), arterial thrombotic disorders such as platelet aggregation (Klages, et al. *J Cell Biol* 1999, 144, 745; Retzer, et al. *Cell Signal* 2000, 12, 645) and leukocyte aggregation (Kawaguchi, et al. *Eur J Pharmacol* 2000, 403, 203; Sanchez-Madrid, et al. *Embo J* 1999, 18, 501), asthma (Setoguchi, et al. *Br J Pharmacol* 2001, 132, 111; Nakahara, et al. *Eur J Pharmacol* 2000, 389, 103), regulation of intraocular pressure (Honjo, et al. *Invest Ophthalmol Vis Sci* 2001, 42, 137) and bone resorption (Chellaiah, et al. *J Biol Chem* 2000, 275, 11993; Zhang, et al. *J Cell Sci* 1995, 108, 2285).

The inhibition of Rho kinase activity in patients has benefits for controlling cerebral vasospasms and ischemia following subarachnoid hemorrhage (*Pharma Japan* 1995, 1470, 16).

The compounds of the Formula I can be made according to routine, conventional chemical methods, and/or as disclosed below, from starting materials which are either commercially available or producible according to routine, conventional chemical methods. General methods for the preparation of the compounds are given below, and the preparation of representative compounds is specifically illustrated in the Examples.

### **General Methods of Preparation**

Compounds of Formula I may be prepared using one of the general methods summarized below in Reaction Schemes 1-3, from either commercially available or readily prepared starting materials. Preparation of starting material is described in Reaction Schemes 4-6.

In the first methods, illustrated in Reaction Scheme 1, the reaction of a chloropyrimidine of Formula II with a substituted aromatic compound of Formula III,

where R<sub>1</sub>–R<sub>4</sub> are as defined above, may be accomplished under either basic or acidic conditions (Reaction Scheme 1).

### Reaction Scheme 1

Alternatively, when R<sub>1</sub> is an aryl group, a two-step scheme may be employed. In the first step, the Formula III compound is allowed to react with the dichloropyrimidine of Formula IIa under acidic conditions as in Reaction Scheme 1. In the second step, the R<sub>1</sub> group is introduced by palladium-catalyzed coupling of a boronic acid of Formula R<sub>1</sub>B(OH)<sub>2</sub> (e.g., Suzuki coupling) to provide compounds of Formula I in which R<sub>1</sub> is aryl (Reaction Scheme 2).

### Reaction Scheme 2

The compounds of Formula I, where R<sub>1</sub> is NR<sub>6</sub>R<sub>7</sub>, may be prepared conveniently by reaction the chloropyrimidine of Formula Ia with a variety of amines of Formula R<sub>6</sub>R<sub>7</sub>NH, usually in a higher boiling polar solvent such as *n*-butanol, and at an elevated temperature, e.g., 90-120 °C as shown in Reaction Scheme 3.

### Reaction Scheme 3

### General Method of Preparation of Intermediates

Intermediate chloropyrimidines of Formula II and aryl amines of Formula III are either commercially available or may be prepared by methods well known in the art. For example, a pyrimidone can be converted to the corresponding chloropyrimidine II by reaction with  $\text{POCl}_3$ , and reduction of nitro aromatic compounds under standard conditions (e.g., Fe, HOAc) provides aryl amines of Formula III. Further illustrative methods are depicted in Reaction Schemes 4–6 below. For example, in Reaction Scheme 4, Formula III compounds in which  $\text{R}_4$  is

, A is 2 or 4 pyridyl, and X is O or S, are prepared by a nucleophilic aromatic substitution reaction of a haloarene (A-halo) with a phenol or thiophenol of Formula IV, carried out in a polar solvent such as DMF and assisted by a base such as potassium carbonate (Reaction Scheme 4).

### Reaction Scheme 4

Intermediates of Formula IIIb may be prepared as shown in Reaction Scheme 5 in two steps from a nitroaromatic compound of Formula V, where Z represents either CH or N. The nitro aromatic compound is allowed to react in basic media at elevated temperatures, and the resulting nitro aromatic compound is reduced by standard means, e.g., iron and acetic acid.

### Reaction Scheme 5

a) base, polar solvent e.g., DMF, heat  
 b) reduction, e.g., Fe, HOAc, H<sub>2</sub>O, rt

A wide variety of chloropyrimidines of Formula II where R<sub>3</sub> is NH<sub>2</sub> and R<sub>1</sub> is other than NR<sub>6</sub>R<sub>7</sub>, may be prepared by the route shown in Reaction Scheme 6 below. Reaction of a carboxylic acid of Formula VI, where R<sub>1</sub> is other than NR<sub>6</sub>R<sub>7</sub>, with a substituted Meldrum's acid of Formula VII (prepared, for example by alkylation of Meldrum's acid with R<sub>2</sub>-halo and base), gives a ketoester of Formula VIII. The pyrimidone compound of Formula IX is formed by reaction of compound VIII with guanidine in the presence of an acid in protic solvent such as ethanol. The pyrimidone of Formula IX is then converted to the chloropyrimidine IIb, (II, where R<sub>3</sub> is NH<sub>2</sub>) under typical conditions, e.g., POCl<sub>3</sub> and heat.

#### Reaction Scheme 6

a) DMAP/DCC/CH<sub>2</sub>Cl<sub>2</sub>, 0 °C - rt; b) pTsOH.H<sub>2</sub>O/R''OH, reflux; c) Guanidine carbonate, HCl, EtOH, reflux; d) POCl<sub>3</sub>, 100 °C

Without further elaboration, it is believed that one skilled in the art can, using the preceding descriptions, utilize the present invention to its fullest extent. The following preferred specific embodiments are, therefore, to be construed as merely illustrative, and not limitative of the remainder of the disclosure in any way whatsoever.

In the foregoing and in the following examples, all temperatures are set forth uncorrected in degrees Celsius; and, unless otherwise indicated, all parts and percentages are by weight.

The entire disclosure of all applications, patents and publications, cited above or below, and U.S. Provisional Application Serial No. 60/349,987, filed January 23, 2002, are hereby incorporated by reference.

### **Experimental Examples**

All reactions were performed in flame-dried or oven-dried glassware under a positive pressure of dry argon, and were stirred magnetically unless otherwise indicated. Sensitive liquids and solutions were transferred via syringe or cannula, and introduced into reaction vessels through rubber septa. Commercial grade reagents and solvents were used without further purification. Thin layer chromatography (TLC) was performed on Analtech UNIPLATE™ pre-coated glass-backed silica gel 60 A F-254 250 μm plates. Column chromatography (flash chromatography) was performed on a Biotage system using 32-63 micron, 60 A, silica gel pre-packed cartridges. Proton (<sup>1</sup>H) nuclear magnetic resonance (NMR) spectra were measured with a Varian (300 MHz) spectrometer with residual protonated solvent (CHCl<sub>3</sub> δ 7.26; MeOH δ 3.30; DMSO δ 2.49) as standard. Low-resolution mass spectra (MS) were either obtained as electron impact (EI) mass spectra or as fast atom bombardment (FAB) mass spectra.

**Intermediate C1**

1-Chloro-2,3-difluoro-5-nitrobenzene

The compound can be obtained by oxidizing 3-chloro-4,5-difluoroaniline, described in JP 05059067, with hydrogen peroxide in trifluoroacetic acid according to a process described in Heaton, A. et al., J. Fluorine Chem. 1997, 81 (2), 133-138 and Krapcho, A.P. et al., J. Org. Chem. 1990, 55 (21), 5662-5664 for the preparation of analogous derivatives.

**Intermediate C2**

4-[(2-Fluoro-4-nitrophenyl)sulphanyl]pyridine

21 g (188.9 mmol) of 4-mercaptopyridine, 30.05 g (188.9 mmol) of 3,4-difluoro-nitrobenzene and 60.05 g (434.5 mmol) of potassium carbonate are dissolved in dimethylformamide, and the mixture is stirred at 40 °C for 3 hours. The reaction solution

is then diluted with 500 mL of ethyl acetate and 300 mL of water. The aqueous phase is extracted five times with in each case 100 mL of ethyl acetate. The combined organic phases are washed with 200 mL of saturated sodium chloride solution, dried over sodium sulphate and concentrated under reduced pressure using a rotary evaporator. The residue is purified by MPLC (mobile phase: ethyl acetate:cyclohexane 1:1).

This gives 37.3 g (79% of theory) of product.

#### Intermediate C4

3-Fluoro-4-(4-pyridinylsulphanyl)aniline

37 g (147.9 mmol) of C2 are dissolved in 1000 mL of ethanol, and 143.86 mL (2.95 mol) of hydrazine hydrate and 4 g of palladium on carbon are added. The reaction mixture is stirred under reflux overnight. After cooling, the mixture is filtered off with suction through silica gel, and the filter cake is washed with ethanol. The filtrate is concentrated under reduced pressure using a rotary evaporator. The residue is suspended in diethyl ether and filtered off with suction. The precipitate is then suspended in water and filtered off with suction. The product is washed two more times with a little water. Drying under high vacuum gives 27.3 g (84% of theory) of product.

3.19 g (11.205 mmol) of C3 are dissolved in 200 mL of ethanol. 638 mg (2.81 mmol) of platinum(IV) oxide are then added, and the mixture is stirred at RT and atmospheric pressure under an atmosphere of hydrogen for 2 hours. ### Examples 24-26

The following general procedure and the appropriate Intermediates A and B provided the compounds described in Table 4 below.

A mixture of Intermediate B (0.250 mmol) and Intermediate ( 0.25 mmol) in 0.01 M aqueous HCl (500  $\mu$ L) was refluxed for 6 h. The reaction was cooled to room temperature and the solvent was evaporated by vacuum. The residue was purified by reverse phase chromatography on a YMC Pack-pro<sup>®</sup> C18 column eluting with acetonitrile/H<sub>2</sub>O (10:90 – 90:10 gradient) to give the desired compound.

In some cases, the compound was further purified by preparative TLC eluting with CH<sub>2</sub>Cl<sub>2</sub>-MeOH (90:10) to give the desired product.

### Example 27

#### Preparation of *N*-[2-amino-6-(4-ethoxyphenyl)-4-pyrimidinyl]-*N*-[3-fluoro-4-(4-pyridinylsulfanyl)phenyl]amine

#### Step 1. Preparation of *N*-(2-amino-6-chloro-4-pyrimidinyl)-*N*-[3-fluoro-4-(4-pyridinylsulfanyl)phenyl]amine

2-Amino-4,6 dichloropyrimidine (A21, 12 mmol) and 3-fluoro-4-(4-pyridinylthio)-aniline (B7, 12 mmol) were suspended in water (150 mL) and treated with 10 drops of concentrated hydrochloric acid. The mixture was stirred at 100 °C overnight. The clear solution was then neutralized with ammonium hydroxide. The precipitated yellow product was filtered, washed with water, and purified by column chromatography with 1-3% MeOH in CH<sub>2</sub>Cl<sub>2</sub> to give the desired product as a white solid (1.98 g, 47%).

Step 2. Preparation of *N*-[2-amino-6-(4-ethoxyphenyl)-4-pyrimidinyl]-*N*-[3-fluoro-4-(4-pyridinylsulfanyl)phenyl]amine

A solution of *N*-(2-amino-6-chloro-4-pyrimidinyl)-*N*-[3-fluoro-4-(4-pyridinylsulfanyl)phenyl]amine from step 1 in toluene (2 mL) in ethanol (1 mL) was treated with aqueous sodium carbonate solution (2M, 0.5 mL). The mixture was then treated with 4-ethoxyphenylboronic acid (0.36 mmol), tetrakis(triphenylphosphine)-palladium (0.009 mmol), and allowed to stir at 120 °C under argon overnight. At this time, the solvents were removed at reduced pressure and the residue was purified by preparative silica gel with 3% MeOH in CH<sub>2</sub>Cl<sub>2</sub> to afford the desired product as a white solid (21 mg).

An equivalent of *N*-(2-amino-6-chloro-4-pyrimidinyl)-*N*-[3-fluoro-4-(4-pyridinylsulfanyl)phenyl]amine (Example 26, step 1, 0.1 mmol) and four equivalents of the desired amine (R<sub>6</sub>R<sub>7</sub>NH) were suspended in *n*-butanol (1 mL) and shaken at 110 °C overnight to 2 days. The solvent was removed at reduced pressure and the residue was

purified either by preparative silica gel plate or by HPLC. The products were checked by LC-MS and TLC and are listed in Table 5 below.

**Preparation of *N*-[2-amino-6-(3-aminophenyl)-4-pyrimidinyl]-*N*-[3-fluoro-4-(4-pyridinylsulfanyl)phenyl]amine**

A dry flask under argon was charged with 10% palladium on carbon (20 mg). A solution of *N*-[2-amino-6-(3-nitrophenyl)-4-pyrimidinyl]-*N*-[3-fluoro-4-(4-pyridinylsulfanyl)phenyl]amine (Example 20, 200 mg, 0.46 mmol) in ethanol (12 mL) and EtOAc (1 mL) was added via syringe through a septa to the palladium on carbon. The flask was then fitted with a hydrogen balloon and stirred at room temperature for 48 h. At this time the palladium was filtered through a pad of Celite<sup>®</sup>. The filtrate was coated on silica and purified on the MPLC (Biotage) with 2-8% MeOH in CH<sub>2</sub>Cl<sub>2</sub> to afford the desired product as a solid (120 mg, 64%). TLC (6% MeOH in CH<sub>2</sub>Cl<sub>2</sub>) R<sub>f</sub> 0.26; MS (ES) 405 [M+H]<sup>+</sup>; <sup>1</sup>H-NMR (DMSO-*d*<sub>6</sub>) δ 5.22 (bs, 2H), 6.45 (s, 1H), 6.49 (bs, 2H), 6.62-6.65 (m, 1H), 6.98 (d, *J*=6.4 Hz, 2H), 7.02-7.16 (m, 3H), 7.43-7.55 (m, 2H), 8.30-8.35 (m, 3H), 9.75 (bs, 1H).

**Rho Kinase Biochemical Assay:**

ROCK-1 activity criteria: 0 no effect (< 40% inhibition), 1 effect (> 40% inhibition). The assay tests for inhibition of ROCK-1 phosphorylation of MBP (Myelin Basic Protein). The reaction (100 µl final volume) is carried out in polypropylene 96-well plates in 50 mM HEPES buffer pH 7.5 containing 5 mM MgCl<sub>2</sub> and 1 mM DTT. For each well, gstROCK1 (0.25 µgs of BAYER DRT gstROCK1) is combined with MBP (1 µg) in reaction buffer (70 µL combined volume). Inhibitors (5 µL of 20x conc. in 40% DMSO) are added to each well to give an 8 point dose response range from 1.0 µM to .5 nM. The reaction is begun by adding 25 µL of ATP (4x = 12 µM) in reaction buffer containing 0.8 µCi of <sup>33</sup>P gamma-ATP (4x) for a final concentration of 3 µM cold and 0.2 µCi hot ATP. Plates were incubated for 1 hour at room temperature with the reaction being stopped by addition of 7 µL of 1 N HCl. The radioactively labeled MBP was transferred to P30 filtermats (EG&G Wallac), washed in 1% phosphoric acid followed by brief washes in water. The filtermats were then dried and the incorporation of <sup>33</sup>P detected by liquid scintillation counting. Background <sup>33</sup>P incorporation is determined by ROCK1 autophosphorylation without MBP. The data are expressed as percent inhibition: % inhibition = 1-((cpm with inhibitor-background)/(cpm without inhibitor - background)) \* 100.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 03/01839

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
  
Although claims 11-14 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
